

Network Address Translation in the Global System for Mobile Communications

Abstract

5 The network address translation system in a Global System for Mobile
Communications network isolates internal IP traffic from external IP traffic in the
Inter-Working Function (IWF) of a Global System for Mobile Communications
network by assigning dual IP addresses for the Inter-Working Function Protocol
Engine. The Inter-Working Function Protocol Engine includes one or more
10 Ethernet Ports, each of which is assigned a private IP address, to connect to the
Ethernet Switch as well as a public IP address of the customer's network, used to
connect to L2TP Network Server.
